POLAND

Every Day is Easy–Peasy

What do they say? That if it's not on the net, it doesn't exist. It is already painfully true – without online ad you cannot run a business; no connection, no online classes. The internet has become a central point of people's lives. How will the Internet of the Future look like?

With 3D printers we will be able to print whatever comes to mind (with a danger of possessing something which can be harmful! The opportunities bear a great responsibility!). Imagine going online, clicking on a chosen project that is already available – and making it come true via your own printer! House? Check. A Brand New car? Sure! Anything? Why not!

Being single? Not anymore! The system will show me five candidates, best–suited, top of the top. Why not make it easier in this already–digital–world?

Artificial intelligence can take over many positions that are now occupied by people. Forget about Siri or Alexa. I can see that in the future, thanks to some advanced technology (maybe an app available for everyone to be downloaded on the phone) we will be able to take care of everything. Food? But what do I want? Hmmm…The app will know before me! And before I know, a steaming delicious meal is in front of me! I'm feeling slightly under the weather? No need for a doctor! Diagnosing illnesses will be as easy as buying a ticket to the cinema! And speaking of cinema. Why going out, if the movies released a second ago are available to watch at home, with a freshly made popcorn right round the corner?

Do I really want to give my thoughts to be analyzed by some machine? I guess so…Nowadays everything is being tracked anyways! We already see the future, when ads appear right after searching for a specific product or even mentioning it in a „private" convo. If it's our reality now, the future holds many more changes. I guess I am ready for them. It can be scary at first, yes, but we have to keep up with it for further development.
