8.2 Metabolites considered in the assessment

Table 8.2-1: Metabolites of Ferric phosphate potentially relevant for exposure assessment

Metabolite	Molar mass	Chemical structure	Maximum observed occurrence in compartments	Exposure assessment required due to
None				

8.3 Rate of degradation in soil (KCP 9.1.1)

Studies on degradation in soil with the formulation were not performed, since it is possible to extrapolate from data obtained with the active substance.

8.3.1 Aerobic degradation in soil (KCP 9.1.1.1)

8.3.1.1 Ferric phosphate and its metabolites

Not applicable.

According to EFSA conclusions (EFSA Journal 2015;13(1):3973), Ferric phosphate is an inorganic salt with a very low solubility in water (1.86×10^{-12} g FePO₄/L at 25°C). As such the insolubility of ferric phosphate and the adsorption to soil particles ensures that breakdown is a slow process while the granule itself remains in situ on application to soil. A major source of dissipation in the environment is likely to be due to ingestion over time by target pests.

8.3.2 Anaerobic degradation in soil (KCP 9.1.1.1)

Not applicable.

According to EFSA conclusions (EFSA Journal 2015;13(1):3973), Ferric phosphate is an inorganic salt with a very low solubility in water (1.86×10^{-12} g FePO₄/L at 25°C). As such the insolubility of ferric phosphate and the adsorption to soil particles ensures that breakdown is a slow process while the granule itself remains in situ on application to soil. A major source of dissipation in the environment is likely to be due to ingestion over time by target pests.

8.4 Field studies (KCP 9.1.1.2)

8.4.1 Soil dissipation testing on a range of representative soils (KCP 9.1.1.2.1)

8.4.1.1 Ferric phosphate and its metabolites

Not applicable.

According to EFSA conclusions (EFSA Journal 2015;13(1):3973), Ferric phosphate is an inorganic salt with a very low solubility in water (1.86×10^{-12} g FePO₄/L at 25°C). As such the insolubility of ferric phosphate and the adsorption to soil particles ensures that breakdown is a slow process while the granule

itself remains in situ on application to soil. A major source of dissipation in the environment is likely to be due to ingestion over time by target pests.

8.4.2 Soil accumulation testing (KCP 9.1.1.2.2)

Not applicable.

According to EFSA conclusions (EFSA Journal 2015;13(1):3973), Ferric phosphate is an inorganic salt with a very low solubility in water (1.86×10^{-12} g FePO₄/L at 25 °C). As such the insolubility of ferric phosphate and the adsorption to soil particles ensures that breakdown is a slow process while the granule itself remains in situ on application to soil. A major source of dissipation in the environment is likely to be due to ingestion over time by target pests.

8.5 Mobility in soil (KCP 9.1.2)

Not applicable.

Specific data addressing adsorption/desorption and mobility in soil were not submitted. Due to the fact that the active substance is practically insoluble in water and that both iron and phosphate ions are ubiquitous components of soils occurring in amounts much greater than those applied a risk of ground water contamination resulting from application of FERROCIOUS according to the GAP is not expected.

8.5.1 Column leaching (KCP 9.1.2.1)

Not applicable.

8.5.2 Lysimeter studies (KCP 9.1.2.2)

Not applicable.

8.5.3 Field leaching studies (KCP 9.1.2.3)

Not applicable.

8.6 Degradation in the water/sediment systems (KCP 9.2, KCP 9.2.1, KCP 9.2.2, KCP 9.2.3)

Studies on degradation in water/sediment systems with the formulation were not performed, since it is possible to extrapolate from data obtained with the active substance.

8.6.1 Ferric phosphate and its metabolites

Not applicable.

8.7 Predicted Environmental Concentrations in soil (PEC_{soil}) (KCP 9.1.3)

8.7.1 Justification for new endpoints

Not relevant as there is no deviation to the EU agreed endpoints.

8.7.2 Active substance and relevant metabolite

Table 8.7-1: Input parameters related to application for PEC_{soil} calculations

Use No.	1	2	3	4	5	6
Crop	Fruit crops	Vegetable crops*	Field crops	Grapevine	Ornamentals	Hop
Application rate (g as/ha)	207.9					
Number of applications/interval	4 / 14					
Crop interception (%) ¹	40	0		40	0	
Depth of soil layer (relevant for plateau concentration) (cm)	5	20		5	20	

*Worst case

Table 8.7-2: Input parameter for active substance(s) and relevant metabolite(s) for PEC_{soil} calculation

Compound	Molecular weight (g/mol)	Max. occurrence (%)	DT50 (days)	Value in accordance to EU endpoint y/n/ Reference
Ferric phosphate	150.82	-	Since no degradation is assumed, a cumulative PEC _{soil} for multiple application (4 x 207.9 g as/ha) was calculated. No time weighted average values for short term or long term were calculated.	y/EFSA Journal 2015;13(1):3973

8.7.2.1 Ferric phosphate and its metabolites

Table 8.7-3: PEC_{soil} for Ferric phosphate

PEC _{soil} (mg/kg)	Vegetable crops			
	Single application		Multiple applications	
	Actual	TWA	Actual	TWA
Initial	0.277	-	1.109	-
Plateau concentration	Not applicable	-	-	-

8.7.2.2 PEC_{soil} of FERROCIOUS

Since FERROCIOUS is rapidly broken down into its constituent parts on contact with soil and/or crop material, it is appropriate to calculate the PEC_s following a single application only, using the following equation:

$$PEC_S(mg/kg) = \frac{\text{Application rate (g/ha)} \times (1-F)}{100 \times \text{Soil depth (cm)} \times \text{Soil dry bulk density (g/cm}^3\text{)}}$$

Table 8.7-4: PEC_{soil} for FERROCIOUS on Cereals

Preparation	Application rate (g s.a/ha)	Crop interception (%)	PEC _{act} (mg/kg)
FERROCIOUS	4 x 7000	0	37.333

zRMS comments:

zRMS agree with PECs calculation.
 Maximum PEC_{soil} value for ferric phosphate was 1.109 mg/kg, following the highest application rate of 4 x 207.9 g Ferric phosphate/ha.

8.8 Predicted Environmental Concentrations in groundwater (PEC_{gw}) (KCP 9.2.4)

8.8.1 Justification for new endpoints

Not relevant as there is no deviation to the EU agreed endpoints.

8.8.2 Active substance and relevant metabolite (KCP 9.2.4.1)

According to EFSA conclusions (EFSA Journal 2015;13(1):3973), Ferric phosphate is practically insoluble in water. Iron and phosphate ions are ubiquitous components of soils occurring in amounts much greater than those applied according to the GAP. A risk of ground water contamination resulting from application of ferric phosphate is not expected.

According to the very low solubility of the active substance in water (1.86 x 10⁻¹²g FePO₄/L at 25 °C), which differs by orders of magnitude from the relevant criterion of water quality for water intended for human consumption (indicator parameter 200 µg/L set for iron by Council Directive 98/83/EC) the calculation of PEC_{gw} values is considered not relevant. It can be concluded that for the active substance FePO₄ due to its very limited water solubility, groundwater concentrations will be < 0.1µg/L as required for pesticide active substances by European Parliament and Council Directive 2006/118/EC.

zRMS comments:

The submitted justification was accepted. Ferric pyrophosphate is practically insoluble in water, and iron and phosphorus ions are commonly found in the environment and all living organisms. The use of plant protection products with ferric pyrophosphate will not pose a risk of ground water contamination.

8.9 Predicted Environmental Concentrations in surface water (PEC_{sw}) (KCP 9.2.5)

8.9.1 Justification for new endpoints

Not relevant as there is no deviation to the EU agreed endpoints.

8.9.2 Active substance, relevant metabolite and the formulation (KCP 9.2.5)

According to EFSA conclusions (EFSA Journal 2015;13(1):3973). Due to the very low solubility no PEC surface water calculations need to be performed for ferric phosphate. For the aquatic risk assessment, the maximum solubility in water (1.86×10^{-12} g/L) can be used.

8.9.3 PEC_{sw}/sed of FERROCIOUS

As the Iron phosphate is a granular application no drift is expected. Therefore, no calculations have been done for surface water and sediment.

zRMS comments:

zRMS agree with the argumentations submitted by the applicant.

The EFSA 2015 concluded: due to the very low solubility no PEC surface water calculations were performed for ferric phosphate. For the aquatic risk assessment the maximum solubility in water (1.86×10^{-12} g/L) can be used.

No modelling of risk of contamination of surface water is required in this case, as the a.s. has a very low water solubility and ferric and phosphate ions occur naturally. No further calculation is required.

8.10 Fate and behaviour in air (KCP 9.3, KCP 9.3.1)

Table 8.10-1 Summary of atmospheric degradation and behaviour

Compound	Ferric phosphate
Direct photolysis in air	Not applicable
Quantum yield of direct phototransformation	Not applicable
Photochemical oxidative degradation in air	Not applicable
Volatilisation	Non volatile
Metabolites	None

The vapour pressure at 20 °C of the active substance Ferric phosphate is regarded as non-volatile. Therefore exposure of adjacent surface waters and terrestrial ecosystems by the active substance Ferric phosphate due to volatilization with subsequent deposition should be considered.

zRMS comments:

Agreed, and in accordance with EFSA's conclusion on ferric phosphate. The fate of ferric phosphate in air does not need to be assessed further.

Appendix 1 Lists of data considered in support of the evaluation

Tables considered not relevant can be deleted as appropriate.

MS to blacken authors of vertebrate studies in the version made available to third parties/public.

List of data submitted by the applicant and relied on
